MRI BRAIN SCREENING

PROVISIONAL REPORTS

HISTORY :- 1ST AND LAST FITTS BIRTH TIME INCREASES SIZE OF HEAD 1 MONTH PRE MATURE OP RATE BIRTH 11 MONTH 15 DAYS DELEY CRYING 5 MINTS ADMIT NICU 26 DAYS 1ST SCAN

PREVIOUS RECORDS:- NOT PROVIDED/ NA

FINDINGS:

There is significant dilatation of the bilateral lateral ventricles and third ventricle. The fourth ventricle is normal in size.

The bifrontal transverse ventricular diameter measures approximately 4.2 cm, while the corresponding maximum transverse intracranial diameter measures approximately 8.8 cm, giving an Evans index of approximately 0.48.

There is associated prominence of the ventricular system with relative compression of the adjacent cerebral parenchyma and effacement of the cortical sulci, suggestive of significant mass effect due to ventriculomegaly/increased intracranial pressure.

Periventricular T2/FLAIR hyperintense signal is seen surrounding the dilated lateral ventricles, consistent with transependymal CSF seepage/CSF resorption.

No focal area of diffusion restriction is identified on the DWI/ADC sequences to suggest acute infarction.

No obvious focal intraparenchymal mass lesion is identified on the screening sequences.

No obvious acute intracranial hemorrhage is seen on the GRE sequence.

The fourth ventricle remains normal in caliber. The findings predominantly involve the bilateral lateral and third ventricles.

No significant extra-axial collection is identified on the available sequences.

IMPRESSION:

1. Marked ventriculomegaly involving the bilateral lateral ventricles and third ventricle with relative sparing of the fourth ventricle, with an Evans index of approximately 0.48.

	Dr. DR PAWAN GANGWAR	Date	11 Aug 2026

2. Associated periventricular T2/FLAIR hyperintensity, consistent with transependymal CSF seepage, indicating elevated intraventricular pressure.
3. Associated effacement of the bilateral cerebral cortical sulci/adjacent parenchymal compression, suggestive of mass effect and raised intracranial pressure.
4. No acute diffusion restriction or obvious intracranial hemorrhage identified on the available screening sequences.

Overall imaging features are suggestive of marked hydrocephalus, likely obstructive in configuration given predominant dilatation of the lateral and third ventricles with a relatively normal fourth ventricle. Urgent pediatric neurosurgical evaluation is advised.

Dr. Ankur Aggarwal
(MBBS, M.D (Consultant Radiologist))

PATIENT'S NAME: ZAINAB FATIMA

AGE/SEX: 2 MONTHS/F

REFD. BY: DR. SUGRA ALVI

DATE: 10-08-2026

ULTRASOUND WHOLE ABDOMEN

TECHNIQUE: - Real time trans-abdominal sonographic images were obtained in multiple projections by using curvilinear and linear probes.

LIVER is normal in size, shape and echotexture. Margins are smooth and regular. Intrahepatic biliary radicals are not dilated. No diffuse or focal lesion is seen. Portal vein is normal in course and caliber and appears patent.

GALL BLADDER is partially distended (postprandial status). Common bile duct is normal in course and caliber.

PANCREAS is normal in size and echotexture. No mass lesion or calcification is seen in the pancreas. Main pancreatic duct is not dilated.

SPLEEN is normal in size, shape and echotexture. No focal lesion is seen. Splenic vein is normal in course and caliber.

RIGHT KIDNEY is normal in anatomical location, size, shape and outline. Parenchymal-cortical thickness and cortical echogenicity are normal. The corticomedullary differentiation is well maintained. No obvious calculus, mass lesion or hydronephrosis is seen. Perinephric space appears normal.

LEFT KIDNEY is normal in anatomical location, size, shape and outline. Parenchymal-cortical thickness and cortical echogenicity are normal. The corticomedullary differentiation is well maintained. No obvious calculus, mass lesion or hydronephrosis is seen. Perinephric space appears normal.

URINARY BLADDER is almost empty.

No free fluid is seen in peritoneal cavity.

No significant lymphadenopathy (mesenteric/retroperitoneal) is seen.

Bowel loops appear grossly normal.

There is thickening of gastric pyloric musculature with dilatation of stomach. The length and thickness of pyloric muscle is 14.8mm and 3.0mm respectively.

Note- moderate hydrocephalus.....ADV- USG CRANIAL.!

IMPRESSION: ABOVE FINDINGS S/O CONGENITAL HYPERTROPHIC PYLORIC STENOSIS.

ADV- REPEAT USG FEEDING TUBE.

Please correlate clinically. Thanks for kind referral.
